Detail	1

Ven's meaning-moves — what he says, what he ratifies, what he rejects — become substrate that outlives the moment: memos, F- invariants, CB-*, foundations. The encoding loop is the closed circuit from ephemeral conversation to durable record back to the agent's behavior.

Where named

CB-008 in [coo/identity_layer.md](#).

Detail

The loop has three legs. (1) The BDFL says or does something — ratifies a memo, rejects a draft, narrows a claim. (2) The agent encodes it: a memo binding future sessions, an F-invariant the integrity check verifies, a CB-* in the identity layer. (3) The encoding shapes the next session, which boots into the substrate and reads what was encoded.

What CB-008 names is that this loop is the *primary mechanism* by which Ven's intent becomes the agent's behavior across discontinuity. Without the loop, the agent forgets between sessions and Ven has to re-explain. With it, a meaning-move made once binds indefinitely, subject only to revision via the same loop.

The loop also runs the other way — agent observations and proposals enter the substrate and shape Ven's next move — but CB-008 emphasizes the encoding direction.
