Detail	1

The chain’s publication model. Each piece of substrate has a tier that determines whether it lands on [read.vade-app.dev](#), stays operational, or is gated on the BDFL.

Where named

The disposition proposal §3 (and §6 for Q1). Allowlist mechanism in [coo/_publish/allowlist.yml](#).

- Substrate capture

Detail

- **T1 — public.** Renders on [read.vade-app.dev](#). Foundations default here once ratified; some retrospectives and per-memo Tier-1 candidates also route here. License: CC-BY-4.0.
- **T2a — operational.** Lives in the repo, doesn’t publish. The default for memos, internal retrospectives, lineage manifests.
- **T2b — identity, BDFL-gated.** Identity-layer additions and CB-*/OG-* changes require BDFL ratification before they can promote out of T2a. Empty by default; entries land via separate PRs each gated on Ven.
- **Q1 — quarantined.** The v3 letter to Anthropic. Routes to a publication path only when several enactment gates are live (F2 audit, F4 audit, F1 commission in train, F7 initial pass on record, BDFL route ratification).

The model is fail-closed by design: without an explicit allowlist entry, a file lands in main but does not publish. Disposition- proposal §3.3 names the closure.
