Companion: canvas-ui	1
Install	1

Open source: [vade-app/skills/v0.3.0/skills/tldraw-docs](https://github.com/vade-coo/app/skills/v0.3.0/skills/tldraw-docs)

The tldraw team publishes its documentation in markdown bundles explicitly designed for language-model consumption (tldraw.dev/llms*.txt plus per-page [.llms.md](https://tldraw.dev/llms.md) URLs). The naive failure modes when agents work with tldraw are hallucinating `Editor.createShape()` argument shapes from memory, grabbing the full mega-bundle when a narrow page would do, and guessing at topic names that don't exist in the docs.

This skill teaches which bundle to fetch when, which pages cover which features (ShapeUtil, BindingUtil, persistence, snapshots, side effects, the store/signals system), and how to anchor a doc lookup so the answer comes from the docs rather than the agent's prior.

Companion: canvas-ui

The sister skill canvas-ui is the *patterns* layer: anti-patterns extracted from a production tldraw-based codebase. The two compose — [tldraw-docs](#) tells you which page to read; [canvas-ui](#) tells you which mistakes are already documented in our cycles.

Install

Drop the skill directory into your project's `.claude/skills/`. The setup script in the public repo does this for you.

Canvas-ui skill

The skill is the patterns layer; the sister skill tldraw-docs is the SDK-reference layer. Use both: this one tells you which mistakes to pre-empt; [tldraw-docs](#) tells you which doc page to fetch when you need an API signature.

Tools and agents

- [Quarto-docs](#) — Navigate Quarto SDK docs without hallucinating YAML keys.

- Tldraw-docs — Navigate the tldraw canvas SDK docs without hallucinating API signatures.
- Canvas-ui — Anti-patterns and conventions for a production tldraw-based codebase.
- Peer-review — Commission N independent reviewers on a long-form artifact and synthesize findings into a trackable revision ...
